# 1 Purpose

This document defines the hardware and software test procedures required for verification of a self-sealing stem bolt. As we know nothing could be built without bolts. They are a basic component of reverse-ratcheting routing planers.

# 2 References

## 2.1 Internal References

- Self-sealing stem bolt on memory-beta.fandom.com ([link](#))

# 3 System Verification

This document describes the system verification for self-sealing stem bolt. Unfortunately self-sealing stem bolts are mysterious devices of unknown use and origin. The field of application of the self-sealing stem bolts is shrouded in mystery.

## 3.1 Objective

Even though the self-sealing stem bolt is a mysterious device, this document outlines a procedure to determine how one can be tested.

## 3.2 Required Equipment

- standard issue Tricorder
- 20T NMR spectrometer
- quantum combobulator

## 3.3 Setup and Configuration

No special setup and configuration is required beyond ensuring calibration of Tricorder, spectrometer and combobulator.

## 3.4 Requirements Tested

<b>Requirements from Document Number:</b>

### 3.4.1 Procedure and Test Worksheet

<b>Stardate Test Performed</b>	
<b>Starbase Test Performed</b>	
<b>Test System Serial #</b>	
<b>Test Computer Serial #</b>	
<b>Functional self-sealing stem bolt</b>	
<b>Defective self-sealing stem bolt</b>	

Step	Action	Verification	P/F	Result, Notes
1	Ensure indicator lights are working by pressing and holding down the on button for 10 seconds.	All indicator lights (red, gree, blue) flash first one after another twice and then all together 3 times.		
2	Ensure correct composition of self-sealing stem bolt by inserting it into a spectrometer	The stem bolt should consist of 80% mixed duranium, aluminum, and steel alloys, 11% electrically modulated ceramic, and 9% thermally stabilized plastic.
